INTRODUCTION

The mechanical drive train comprises individual units such as motor, gear unit and driven machine. The coupling connects these component assemblies.
As well as the transmission of rotary motion and torque, other requirements may be made of the coupling.

- Compensation for shaft misalignment with low restorative forces
- Control of characteristic angular vibration frequency and damping
- Interruption or limitation of torque
- Noise insulation, electrical insulation

Couplings are frequently chosen after the machines to be connected have already been selected. Thanks to a large number of different coupling assembly options, specified marginal conditions for clearance and connection geometry can be met from the standard range. The coupling also performs secondary functions, e.g. providing a brake disk or brake drum for operating or blocking brakes, devices to record speed or the attachment of sprockets or pulleys.

Couplings are divided into two main groups, couplings and clutches.

Clutches interrupt or limited the transmissible torque. The engaging and disengaging forces on externally operated clutches are introduced via a mechanically, electrically, hydraulically or pneumatically operating mechanism. Overload, centrifugal or freewheel clutches draw their engaging energy from the transmitted output.

Rigid couplings, designed as clamp, flanged or mechanism couplings, connect machines which must not undergo any shaft misalignment. Hydrodynamic couplings, often also called fluid or Föttinger couplings, are used as starting couplings in drives with high mass moments of inertia of the driven machine. In drive technology very often flexible, positive couplings, which may be designed to be torsionally rigid, torsionally flexible or highly flexible, are used.

Torsionally rigid couplings are designed to be rigid in a peripheral direction and flexible in radial and axial directions. The angle of rotation and torque are conducted through the coupling without a phase shift.

Torsionally flexible couplings have resilient elements usually manufactured from elastomer materials. Using an elastomer material with a suitable ShoreA hardness provides the most advantageous torsional stiffness and damping for the application. Shaft misalignment causes the resilient elements to deform.

Highly flexible couplings have large-volume (elastomer) resilient elements of low stiffness. The angle of rotation and torque are conducted through the coupling with a considerable phase shift.

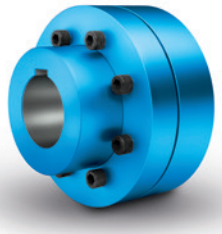
OUR COUPLING GROUPS AT A GLANCE

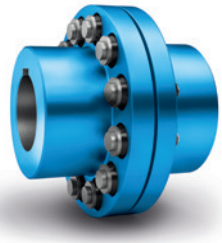
N-EUPEX, RUPEX and N-BIPEX

Flexible Couplings

Flexible Flender couplings have a wide range of possible applications. A broad standard modular system as well as specially designed application-specific couplings are available.



N-EUPEX
cam couplings
Rated torque:
19 Nm ... 85,000 Nm



RUPEX
pin-and-bush couplings
Rated torque:
200 Nm ... 1,690,000 Nm

N-BIPEX
cam couplings
Rated torque:
12 Nm ... 4,650 Nm

ELPEX, ELPEX-B and ELPEX-S

Highly Flexible Couplings

ELPEX® couplings are free of circumferential back-lash. Their damping capacity and low torsional stiff-ness make them especially well-suited for coupling machines with strongly non-uniform torque characteristics or large shaft misalignment.

ELPEX
elastic ring couplings
Rated torque:
1,600 Nm ... 90,000 Nm

ELPEX-B
elastic tire couplings
Rated torque:
24 Nm ... 14,500 Nm

ELPEX-S
rubber disk couplings
Rated torque:
330 Nm ... 63,000 Nm

E

ZAPEX gear couplings and ARPEX all-steel couplings

Torsionally rigid couplings

For transmission of high torques, we offer both ARPEX all-steel couplings and ZAPEX gear couplings in a range of versions. Their purposes of application vary according to specific requirements with respect to shaft misalignment, temperature and torque.

ZAPEX
gear couplings
Rated torque:
1,300 Nm ... 7,200,000 Nm

ARPEX
high Performance Couplings
Rated torque:
1,000 Nm ... 588,500 Nm

N-ARPEX and ARPEX
all-steel couplings
Rated torque:
92 Nm ... 2,000,000 Nm

BIPEX-S and SIPEX

Backlash-free couplings

The vibration-damping, electrically insulating plug-in BIPEX-S elastomer couplings and SIPEX metal bellows couplings with very high torsional stiffness deliver especially isogonal torque transmission.

BIPEX-S and SIPEX
Rated torque:
0.1 Nm ... 5,000 Nm

FLUDEX

Hydrodynamic couplings

The FLUDEX hydrodynamic fluid coupling works according to the Föttinger principle. It functions entirely free of wear.

FLUDEX
fluid Couplings
Power:
1.2 kW ... 2,500 kW

Application-specific couplings

Couplings for rail vehicles must meet high demands. Due to their high degree of standardization and wide variety, they can be used in the most diverse vehicle types.

Railway coupling
Rated torque:
1,000 Nm ... 9,500 Nm

Each wind turbine coupling is designed to optimally meet the requirements of the respective wind turbine. The coupling connects the fast-running gear shaft with the generator shaft and is available for wind turbines with a capacity of up to 12 MW.

Wind turbine couplings
Rated torque:
10,000 Nm ... 60,000 Nm

HIGH PERFORMANCE COUPLINGS ARPEX

GENERAL

ARPEX high performance couplings from the ART series transmit torque by means of the Flender conical bolting connection and a hexagonal, octagonal or decagonal plate pack and in a special edition with MHM and H design as a 12-bolt design. They are suitable for torques ranging to 936000 Nm with a maximum permissible angular misalignment of between 0.12° and 0.35°. The high-quality materials and compact design of the couplings make them light in weight, but capable of high peripheral speeds and torques.

Main areas of application, particularly in the oil and gas industries, the petrochemical industry and in the maritime field:

- Generator drives
- Gas and steam turbines
- Turbo compressors
- Boiler feed pumps
- Marine drives
- Test stands

Characteristics of the ARPEX ART high performance couplings:

- No lubrication necessary
- Backlash-free torque transmission thanks to plate packs with positive-locking Flender conical bolting connection
- Design in accordance with API 671/ISO 10441
- Easy to install with factory-assembled half couplings
- Compact, weight-optimized design
- Low restoring forces
- High balancing quality
- Couplings can be designed for potentially explosive environments in accordance with the ATEX directive, as amended

ARPEX coupling optionally suitable for operation in potentially explosive environments.
Complies with the current ATEX Directive for:

CE II 2G Ex h IIC T6 ... T2 Gb X

II 2D Ex h IIIC T85 °C ... 250 °C Db X

I M2 Ex h Mb X

Benefits

ARPEX high performance couplings have been specially designed for use in high-speed applications. Created by designers with decades of experience using state-of-the-art development and manufacturing tools, ARPEX high performance couplings offer a dependable high-end solution for torsionally rigid torque transmission even with shaft misalignment.

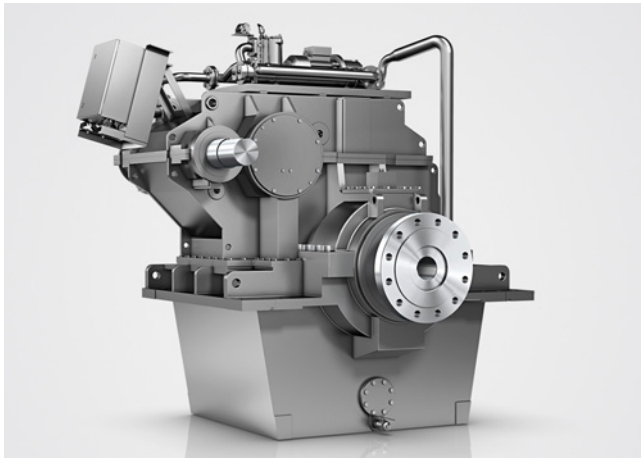
ARPEX high performance couplings can withstand temperatures between -40 °C and +280 °C in operation. On request they can also be specially equipped for use in other temperature ranges.

Application

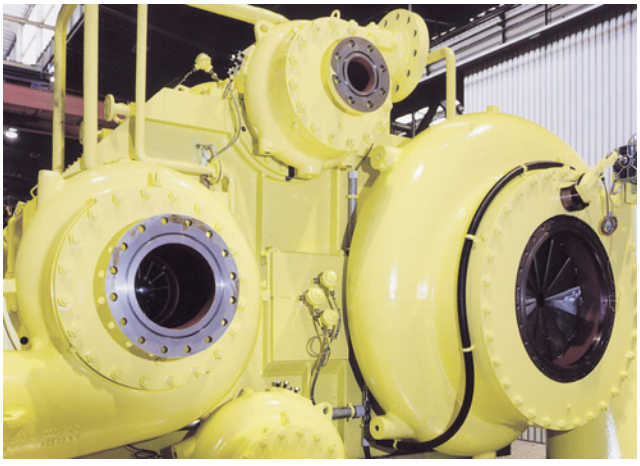
Generator drives

Boiler feed pumps

Gas and steam turbines



Marine drives



Turbo compressors

Test stands

GENERAL

Design and configurations

ARPEX turbo couplings are available in 4 designs. The series are differentiated according to the number of plate pack bolting connections used, i.e. they feature either a hexagonal, an octagonal or a decagonal plate pack. Special editions with 12 bolting connections are available on request for the MHM and H versions.

The version with six connecting elements allows the largest radial and axial shaft misalignment thanks to the high flexibility of the hexagonal plate pack design. This version is thus especially suitable for applications involving a large degree of thermal expansion.

The version with octagonal plate pack combines high torque capacity with high flexibility and thus offers a perfect solution for most high-speed applications.

The 10-bolt version offers high torque capacity at a low shaft displacement of 0.16°. As a result, this design is well suited for applications with high impact torques and low displacement requirements.

The 12-bolt special edition is available for the MHM and H versions on request. In contrast to the 10-bolt version, this special edition provides an increased torque capacity at a reduced shaft displacement of 0.12°. This design is also well suited for applications with high impact torques and low displacement requirements.

The types are differentiated according to the following features:

The compact, "reduced moment" XVX type minimizes the bending moment stress on the connecting shafts.

Type BVB is a lower-cost version of type XVX and is suitable for applications with lower requirements of the moment stresses on the connecting shafts. Type MHM is designed for use with larger shaft diameters.

All versions can also be supplied with flange connections to meet the customer's specifications.

The materials used to manufacture the high performance couplings have been carefully selected and the coupling geometry has been optimized using state-of-the-art FEA-based analysis.

All hubs, flanges, sleeves and plate pack bolting connections are made of high-grade tempered steel. The highly flexible plates are made from stainless steel spring steel and generate very low restoring forces at the bearings. The Flender conical plate pack bolting connection permits positive-locked torque transmission. The intermediate spacers can be dismounted radially without moving the coupled machines.

The couplings meet the requirements of API 671/ISO 10441.

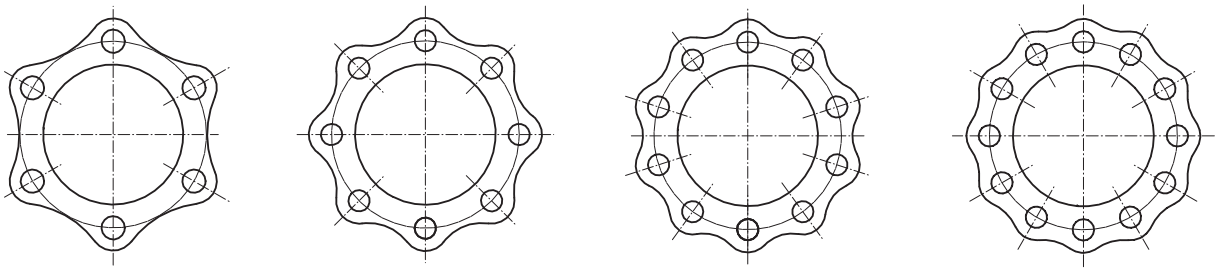
GENERAL

Plates



Series ART-6 | Series ART-8 | Series ART-10 | Series ART-12 (Special edition)

Plate shapes

The operating principle of ARPEX high performance couplings is based on the flexibility of the plate packs. The plate packs combine high flexibility with high torque capacity. This means that torque is reliably transmitted even when shaft misalignments cannot be avoided.

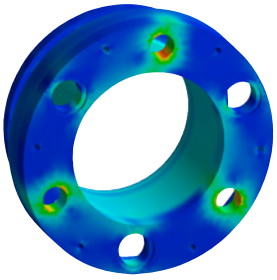
The plates are made of hard-rolled spring steel which is stainless and has an extremely high tensile strength.

The use of very thin individual plates means that the restoring forces induced by shaft misalignment are comparatively low. This has a positive impact on the bearing service life of the coupled machines.

The scalloped design of the plates ensures even distribution of stress in the plates and also reduces the weight and the moment of inertia of the plates.

The plates are designed for unlimited service life with a high degree of operational safety.

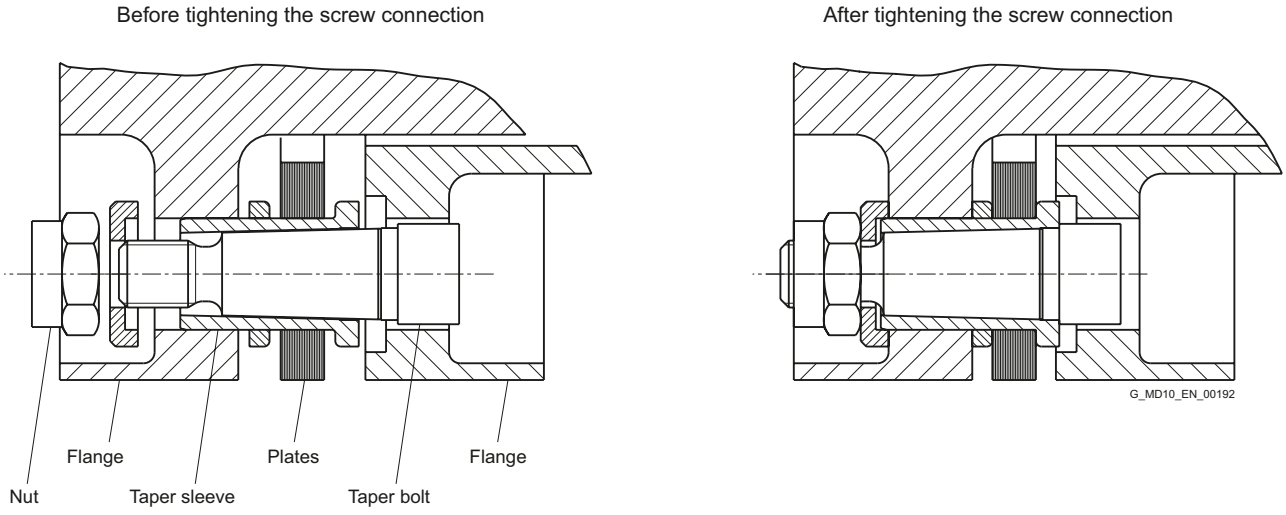
FEA – development of ARPEX high performance couplings



Stress distribution according to the Finite Element Analysis (FEA)

The weight, stiffness and stress distribution of all components of the ARPEX high performance couplings are optimized by FEA analysis. Extensive series of tests have been carried out in order to verify these FEA results and to assess the service life of the components with respect to fatigue life and fatigue limit.

Flender conical bolting connection



Design conical bolting connection

Advantages of the Flender conical bolting connection

- Positive-locked torque transmission
  The main advantage of the conical bolting connection over the use of close-fitting bolts is the creation of a real positive lock inside the plate pack bolting connection. The positive lock is provided by expansion of the conical connection.
- Functioning principle
  The taper bolt is pulled into the taper sleeve when the nut is tightened, causing the sleeve to expand. As a result, a positive backlash-free connection is reliably created between the taper bolt and the sleeve as well as between the sleeve, the flange and the plates.
  This contrasts with typical plate pack bolting connections which use close-fitting bolts to transmit torque by friction.
- Light weight
  While providing the same torque capacity, the conical bolting connection is lighter and has a lower moment of inertia than a close-fitting bolt connection.
- Centering
  The centering accuracy attained by the use of the conical bolting connection is exceptionally high, thus also ensuring high balancing quality.
- Material
  All components of the bolting connection are made of highgrade tempered steel.

GENERAL

Key to symbols

Name	Symbols	Unit	Explanation
Rated coupling torque	T_{KN}	Nm	Torque which can be transmitted as static torque by the coupling over the period of use.
Maximum permissible torque	T_{peak}	Nm	Maximum permissible torque for 10^3 load changes
Maximum coupling speed	$n_{K\,max}$	rpm	Maximum permissible coupling speed
Position of center of gravity	CG	mm	Position of center of gravity for the half coupling
Weight	m	kg	Weight of the coupling
Moment of inertia	J	kgm^2	Moments of inertia in relation to the coupling speed
Torsional stiffness	C_T	Nm/rad	Drehfedersteife der Kupplung
Maximum axial misalignment	$\Delta K_{a\,max}$	mm	Permissible axial misalignment (for the entire coupling)
Maximum axial force	$F_{a\,max}$	N	Maximum axial force (for the entire coupling)
Maximum angular misalignment	$\Delta K_{w\,max}$	°	Permissible angular misalignment

The permissible radial misalignment can be calculated using the following equation:
$K_r = \tan K_w \cdot LR$ with K_r and LR in mm, K_w in °

Technical Information

Balancing

It is basically possible to balance the couplings according to any of the methods described in API 671/ISO 10441, in accordance with DIN ISO 21940 Part 11 or in compliance with similar standards/regulations.

The following options are provided by API 671:

- Component balance (individual balancing of all components) with the possibility of exchanging identical parts
- Assembly check balance to verify the balance of individual components, balance can be corrected only by repeating the component balance; individual components can be assembled in any position
- Assembly check balance with balance correction of the complete coupling; none of the individual components can be exchanged

Transport and assembly aid

The plate packs are immobilized by means of shipping screws for the purpose of balancing, transportation and assembly. These screws protect the plates against damage during transportation or assembly.

It is absolutely essential to remove the shipping screws before the coupling is commissioned.

Axial pretensioning

If it is known in advance that the shaft distance has changed, e.g. as a result of thermal expansion, it is possible to axially pretension the plate packs so that the coupling remains in a neutral position during operation.

Shim packs

The couplings for tapered hub bores are supplied with shim packs. These allow the shaft distance to be corrected by +/- the thickness of one pack.

Shaft-hub connection

ARPEX high performance couplings are normally designed with tapered bores for hydraulic oil assembly or disassembly. Flange versions are also available.

Detailed information must be supplied to ensure accurate design of the hub bores or flanges.

Safety precautions

The purchaser must take measures to prevent any accidental contact with rotating parts.

Assembly and removal of the couplings

All types of ARPEX high performance couplings are designed such that there is no need to move the couplings and coupled machines axially during assembly/removal of the couplings.

Assembly and commissioning

ARPEX high performance couplings must be assembled and commissioned in accordance with Operating Instructions BA 8706, a copy of which is enclosed with every shipped coupling unit.

As-supplied condition

ARPEX high performance couplings are shipped as complete coupling units with preassembled plate packs.

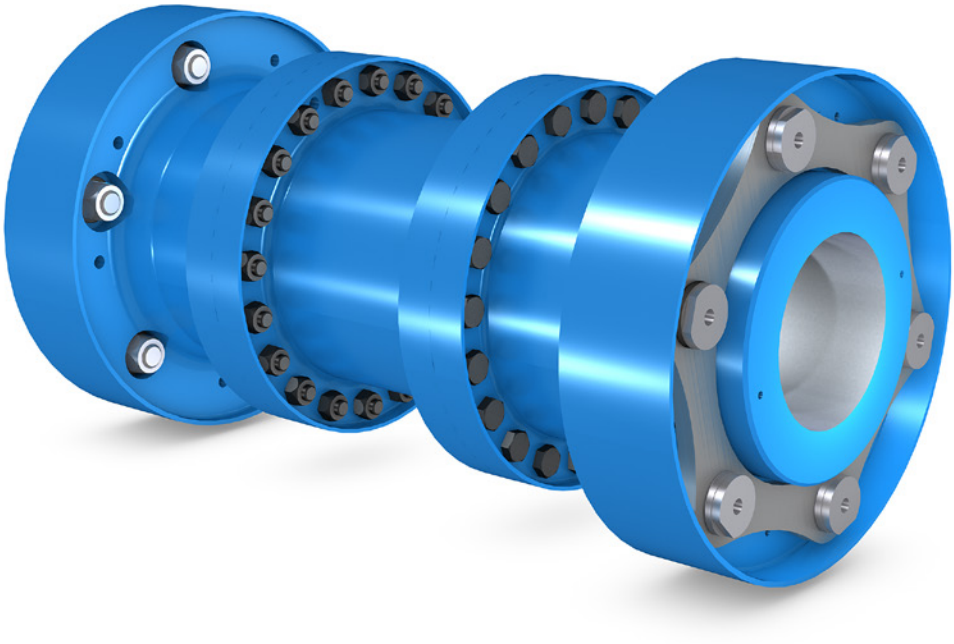
Type XVX is shipped with preassembled "X" subassemblies.
Type BVB is shipped with preassembled "B" subassemblies.
Type MHM is shipped with preassembled "H" subassembly.
Type H is shipped with preassembled "H" subassembly.

These coupling components must not be disassembled without prior consultation with Flender GmbH.

Technical changes

Dimensions and technical data might change as a result of future product developments.

TYPES XVX AND XVF



- The coupling components are arranged in such a way as to minimize the moment stresses on the connecting shafts; ideally suited for turbine compressor drives with exacting requirements with respect to the position of the center of gravity and the weight of the half coupling
- The "X" subassemblies are preassembled at the factory. The spacer "V", which can be separately mounted or removed, can be installed radially in such a way that there is no need to move the driving or the driven machine. As a result, the coupled machines can be separated quickly.
- The spacer length of the coupling is variable. It is also possible to adjust the torsional spring stiffness to suit individual applications.
- Low-windage design

[1] The following specifications relating to weight, mass inertia and torsional spring stiffness refer to a coupling of standard dimensions with maximum hub bores and a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.

[2] The maximum speeds n_{max} might be lower in the case of spacers with a DBSE dimension in excess of 457.2 mm (18").

[3] The maximum angular misalignment $\Delta K_{w\,max}$ and the maximum axial misalignment $\Delta K_{a\,max}$ must not occur simultaneously at 100 %.

Notes

- The specifications relating to weight, mass inertia and torsional spring stiffness refer to a coupling of standard dimensions with maximum hub bores and a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.
- The hub bore and hub length are standard dimensions. Please contact your Flender representative for information about special applications.

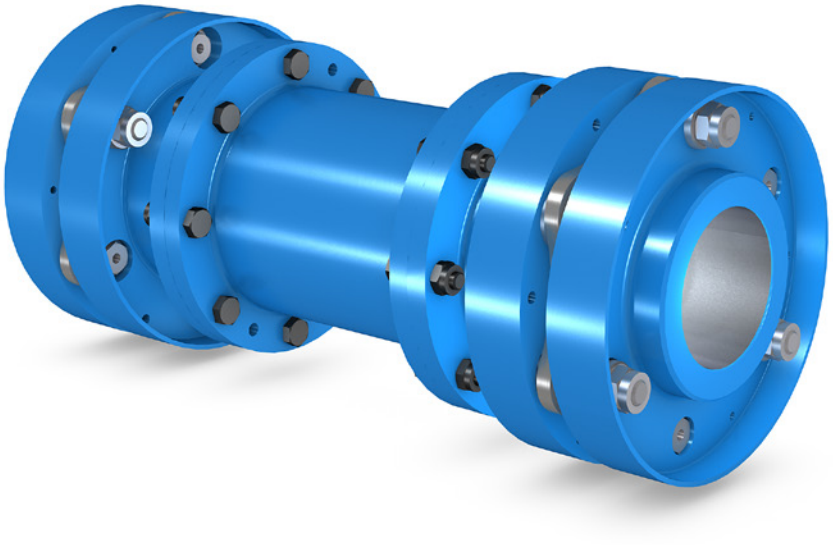
[1] The maximum speeds n_{max} might be lower in the case of spacers with a DBSE dimension in excess of 457.2 mm (18").

[2] The LR dimension refers to a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.

[3] The XVX version is optionally available with a flange connection as the XVF version. Dimensions valid for the XVF version flange connection.

Please contact your Flender contact partner or visit **flender.com** to find the product number and configure other order options.

TYPES BVB AND BVF



- The coupling components are arranged in such a way as to reduce the moment stresses on the connecting shafts; ideally suited for turbine compressor drives with average requirements with respect to the position of the center of gravity and the weight of the half coupling
- The "B" subassemblies are preassembled at the factory. The spacer "V", which can be separately mounted or removed, can be installed radially in such a way that there is no need to move the driving or the driven machine. As a result, the coupled machines can be separated quickly.
- The spacer length of the coupling is variable. It is also possible to adjust the torsional spring stiffness to suit individual applications.
- Low-windage design

Size	Power ratings			Coupling data [1]

[1] The following specifications relating to weight, mass inertia and torsional spring stiffness refer to a coupling of standard dimensions with maximum hub bores and a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.

[2] The maximum speeds n_{max} might be lower in the case of spacers with a DBSE dimension in excess of 457.2 mm (18").

[3] The maximum angular misalignment $\Delta K_{w\,max}$ and the maximum axial misalignment $\Delta K_{a\,max}$ must not occur simultaneously at 100 %.

Notes

- The specifications relating to weight, mass inertia and torsional spring stiffness refer to a coupling of standard dimensions with maximum hub bores and a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.
- The hub bore and hub length are standard dimensions. Please contact your Flender representative for information about special applications.

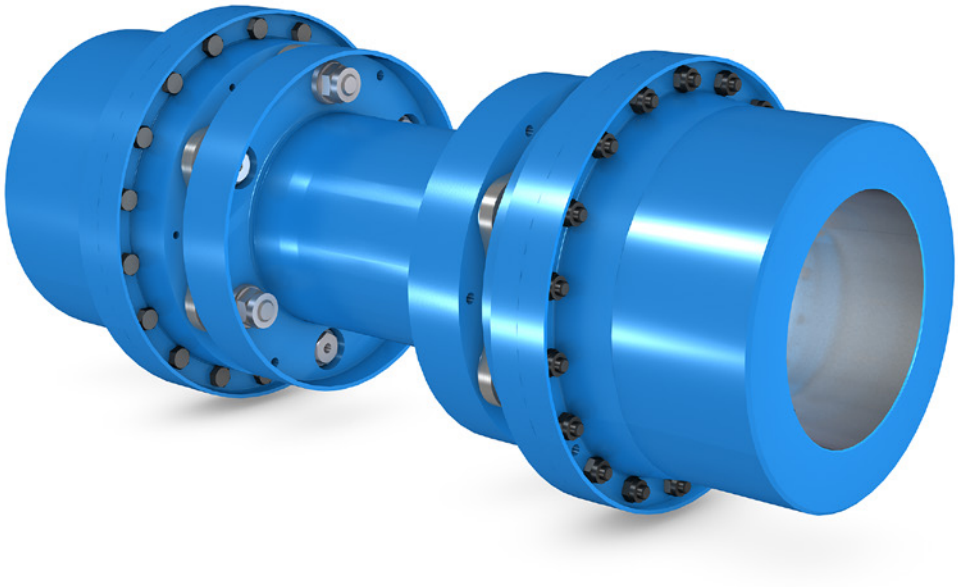
[1] The maximum speeds n_{max} might be lower in the case of spacers with a DBSE dimension in excess of 457.2 mm (18").

[2] The LR dimension refers to a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.

[3] The BVB version is optionally available with a flange connection as the BVF version. Dimensions valid for the BVF version flange connection.

Please contact your Flender contact partner or visit **flender.com** to find the product number and configure other order options.

TYPES MHM AND MH



- The hubs "M" of this coupling design have a larger bore capacity than the BVB type. The MHM type variant is thus used for applications involving large shaft diameters such as electric motors or generator drives
- The factory-mounted subassembly "H" can be installed or removed radially in such a way that there is no need to move the driving or the driven machine. As a result, the coupled machines can be separated quickly for maintenance purposes.
- The flanges of the subassembly can also be adapted to the flange shafts of large gas and steam turbines.
- The spacer length of the coupling is variable. It is also possible to adjust the torsional spring stiffness to suit individual applications.
- Low-windage design

[1] The following specifications relating to weight, mass inertia and torsional spring stiffness refer to a coupling of standard dimensions with maximum hub bores and a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.

[2] The maximum speeds n_{max} might be lower in the case of spacers with a DBSE dimension in excess of 457.2 mm (18").

[3] The maximum angular misalignment $\Delta K_{w\,max}$ and the maximum axial misalignment $\Delta K_{a\,max}$ must not occur simultaneously at 100 %.

Notes

- The specifications relating to weight, mass inertia and torsional spring stiffness refer to a coupling of standard dimensions with maximum hub bores and a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.
- The hub bore and hub length are standard dimensions. Please contact your Flender representative for information about special applications.

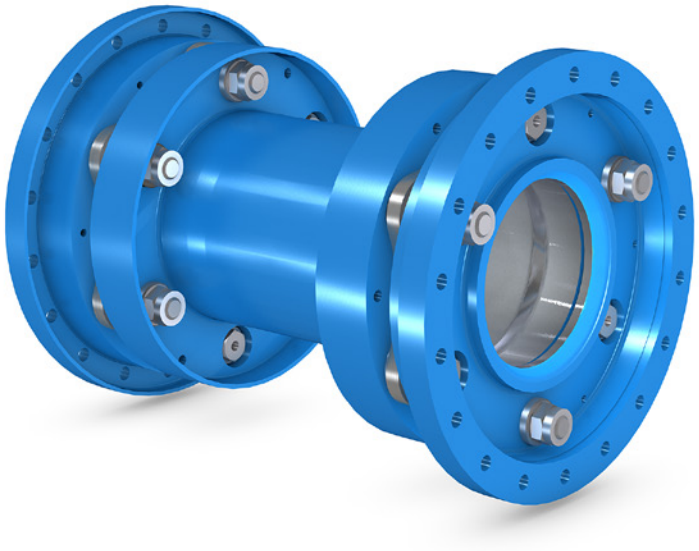
[1] The maximum speeds n_{max} might be lower in the case of spacers with a DBSE dimension in excess of 457.2 mm (18").

[2] The LR dimension refers to a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.

[3] The MHM version is optionally available with a flange connection as the MH version. Dimensions valid for the MH version flange connection.

Please contact your Flender contact partner or visit **flender.com** to find the product number and configure other order options.

TYPE H



- Version H has a flange connection on both sides and is screwed to the flanged shafts of the machines to be connected using fitting screws in the standard versions.
- The factory-mounted subassembly "H" can be installed or removed radially in such a way that there is no need to move the driving or the driven machine. As a result, the coupled machines can be separated quickly for maintenance purposes.
- The flanges of the subassembly can also be adapted to the flange shafts of large gas and steam turbines.
- The spacer length of the coupling is variable. It is also possible to adjust the torsional spring stiffness to suit individual applications.
- Low-windage design

Notes

- The specifications relating to weight, mass inertia and torsional spring stiffness refer to a coupling of standard dimensions with maximum hub bores and a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.
- The hub bore and hub length are standard dimensions. Please contact your Flender representative for information about special applications.

[1] The maximum speeds n_{max} might be lower in the case of spacers with a DBSE dimension in excess of 457.2 mm (18").

[2] The LR dimension refers to a DBSE dimension of 457.2 mm or the dimension S_{min} if S_{min} > 457.2 mm.

Please contact your Flender contact partner or visit **flender.com** to find the product number and configure other order options.

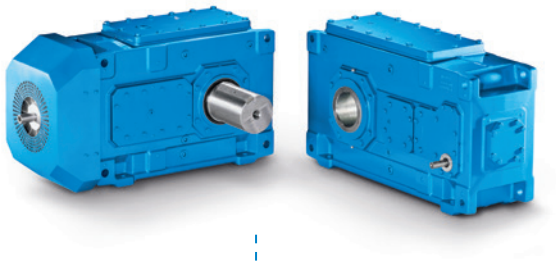
APPENDIX

A

THE RIGHT GEAR UNIT SOLUTION FOR ANY REQUIREMENT

We provide helical and planetary gear units made up of standard modules or as a complete application solution.

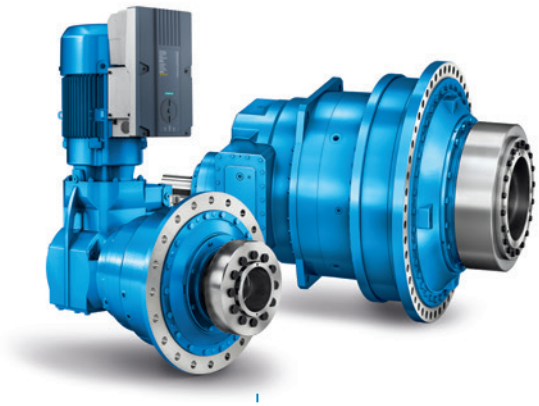
Helical and planetary gear units from Flender are modern drive solutions that satisfy the most varying and extreme demands, day after day and year after year. For decades, plant operators have been achieving high system reliability and low lifecycle costs in every conceivable industry with our helical gear units.



Helical and bevel helical gear units

Flender helical and bevel helical gear units are by far the most comprehensive range of industrial gear units in the world. It ranges from a multi-faceted universal gear unit portfolio and application-specific gear units to customer-specific solutions.

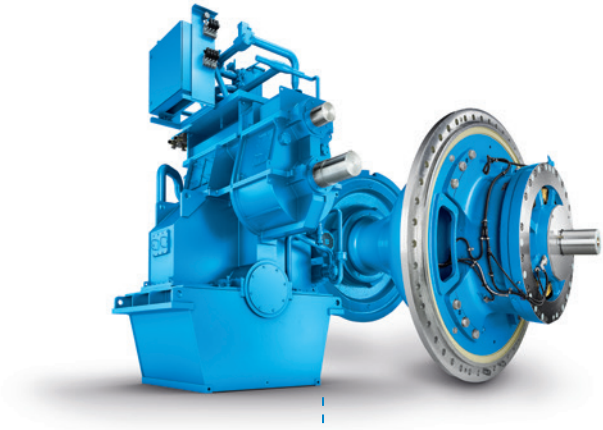
Rated torque: 3,300 Nm ... 1,400,000 Nm



Planetary Gear Units

With Flender planetary gear units, we provide a range of durable, reliable and finely graduated gear unit solutions. The series wins customers over due to its highly integrated planetary geared motor and maximum conformity with all international motor standards. It also brings quality and performance in a good ratio of lifecycle costs to price.

Rated torque: 10,000 Nm ... 5,450,000 Nm



Application-specific gear units

With application-specific gear units, Flender provides by far the most application solutions and thus covers nearly every drive-related need from hundreds of applications in industry and the acquisition of raw materials.

Rated torque: up to 10,000,000 Nm

Customer-specific designs

Our experts are available at any time for special requirements during the development of new products. From designing and simulating complex drive solutions to implementing them, we work together with you to resolve multi-layered tasks.

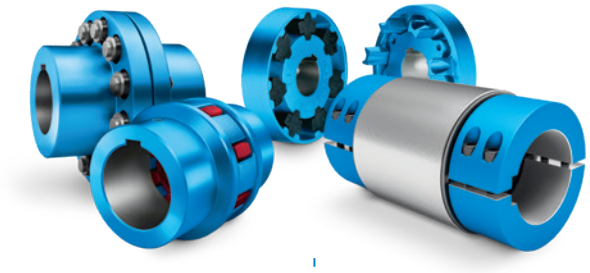
THE PERFECT COUPLING FOR THE PERFECT GEAR UNIT

We provide elastic, highly elastic, rigid and hydrodynamic solutions.

Regardless of which demands are made on the coupling: Low or high performance, demanding operating conditions or high ambient temperatures, dusty or hazardous environments – we have the right portfolio. Our comprehensive range of couplings offers a large number of sizes and designs with a torque range from 0.5 to 10,000,000 Nm.

In over 90 years of development, conception and production, our product portfolio has grown to its current level of diversity. Nearly every matured coupling solution is available as a standard item in our modular system. This saves our customers time and money.

We are a powerful and flexible player in every market in the world – just like our customers. The production of our coupling components aims for maximum quality. As a trio, the setup, material and design result in optimal coupling solutions – rugged, dependable, largely low-maintenance and, above all, available at any time, anywhere. We provide high quality, first class delivery performance, and comprehensive service.



Flexible couplings

Our elastic couplings are pluggable and easy to install. The elastomer element equalizes the shaft offset and absorbs impacts from the motor or driven machine.

Nominal output torque: 12 Nm ... 1,690,000 Nm

Torsionally rigid couplings

Our compact steel couplings provide extremely precise transmission of high torques, especially in harsh operating conditions and extreme temperatures.

Nominal output torque: 92 Nm ... 7,200,000 Nm

Hydrodynamic couplings

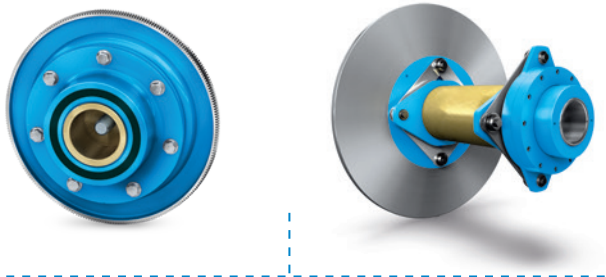
Soft start, overload protection, torsional vibration damping – FLUDEX® fluid couplings allow the torque-limited approach and have very little slippage at rated load.

Power: 1.2 kW ... 2,500 kW

Highly-flexible couplings

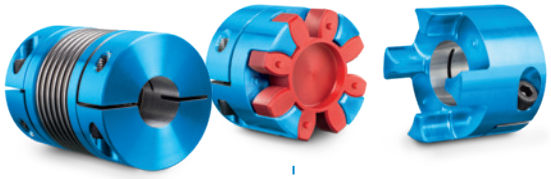
Highly flexible couplings are well-suited for connecting machines that operate asymmetrically. They are preferred for use in systems that are periodically operated.

Nominal output torque: 24 Nm ... 90,000 Nm



Application-specific couplings

Flender offers a variety of application-specific couplings for rail vehicles and use in wind energy generation.



Backlash-free couplings

Our couplings act as a modular interface between the motor and the work machine to ensure reliable, backlash-free power transmission in servodrives and positioning drives.

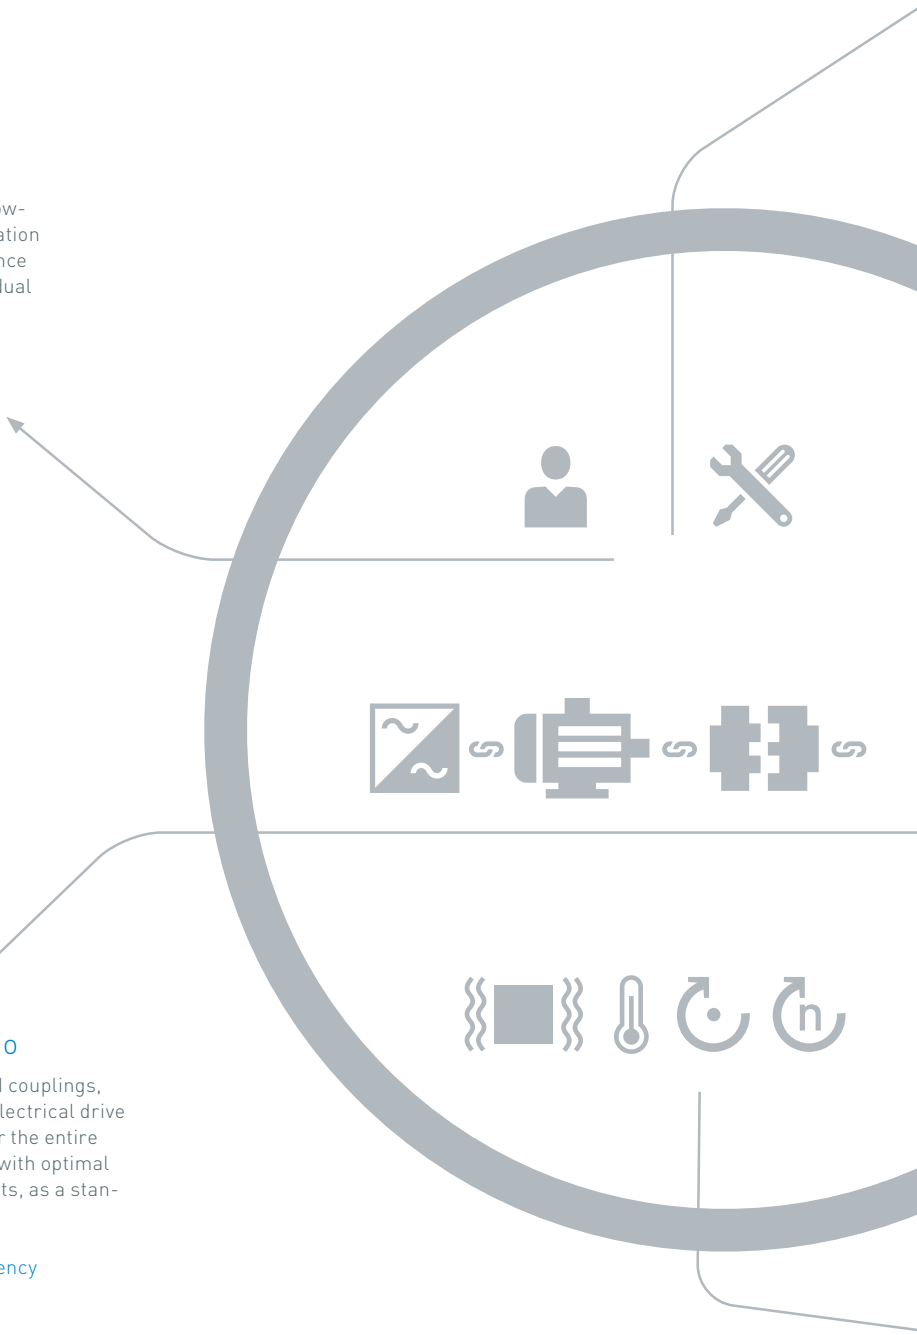
Nominal output torque: 0.1 Nm ... 5,000 Nm

Flender's system competence turns first-class components into systems with tangible added value. Drive systems from Flender ensure maximum productivity, energy efficiency and reliability in any automation environment.

Consultation

Our customers use our interdisciplinary know-how, our application competence, our innovation strength and, last but not least, our experience to find the right drive system for their individual requirements.

Reduced engineering time, lower costs



Integrated drive portfolio

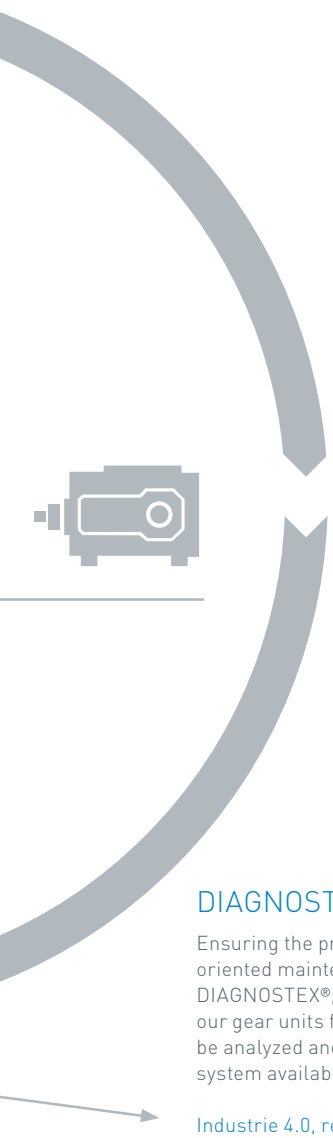
We not only provide gear units and couplings, but also have the competence in electrical drive technology that enables us to offer the entire drive train – perfectly integrated, with optimal interaction between all components, as a standard or individual solution.

Fewer interface risks, more efficiency

Flender service

From diagnostics and support, replacement part and repair services, all the way to maintenance and retrofit services – the Flender service portfolio creates individual solutions, fully and completely tailored to the needs of our customers. In this way, a gear unit remains an original Flender gear unit.

Increased system availability, reduced lifecycle costs



DIAGNOSTEX

Ensuring the process stability requires status-oriented maintenance of the drive train. With DIAGNOSTEX®, sensors measure deviations of our gear units from the target status. These can be analyzed and evaluated in terms of maximized system availability.

Industrie 4.0, reduced costs

INDIVIDUAL SOLUTIONS.

We have the right solution for you, even if your requirements are special. We no longer have to newly develop every special solution. Many solutions are already available.

At **flender.com**, we provide application-specific solutions for your special requirements.

Use our online configurator, which allows you to create tailored product combinations.

GREAT EXPERTISE IN YOUR INDUSTRY TOO.

Each industry has its own conditions. Every application has its own specific requirements. We are looking forward to meeting your challenges.

We probably already have the right solution at hand. Here are a few examples:

Minerals and mining

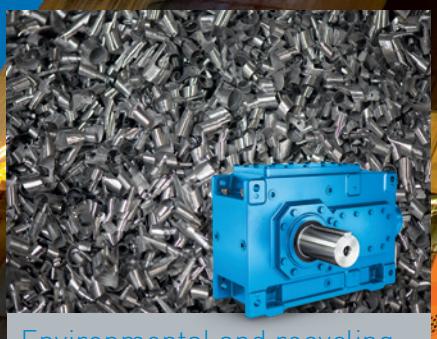
Requirement:
Perfectly coordinated drive system

Cement

Requirement:
Low maintenance effort and cost, sealing due to dirt in surroundings

Plastics and rubber

Requirement:
Absorption of high axial forces, suitability for explosion protection



Environmental and recycling

Requirement:
Highest possible reliability, rugged design

Pulp and paper

Requirement:
Suitability for centrally located lubrication

Industrial cranes

Requirement:
Quick availability, version with double drive shaft

Chemicals

Requirement:
Absorption of forces from the manufacturing process

Power generation

Requirement:
Effective cooling, speed adjustment for motor to fan

Metals

Requirement:
Harsh working conditions, high peak loads

Harbor cranes

Requirement:
Specific axle clearance, frequent start-up

Oil and gas

Requirement:
Flexible adaptation to speed requirements

Water and wastewater

Requirement:
Absorption of external forces, oil-retaining pipe required

AN ORIGINAL FOR THE LONG TERM WITH ORIGINAL FLENDER SERVICES

Ever increasing requirements make it more and more important for industrial plants to work with maximum productivity and efficiency. Flender Services give companies a decisive advantage over the competition in industry, the acquisition of raw materials and energy production. In view of the high cost pressure, increasing energy prices and stricter and stricter environmental stipulations, our services are becoming a decisive factor to success over the competition.

Enjoy the support of our service experts, from planning, development and operation to the modernization of your plant and benefit from our experience and in-depth know-how of your application – in more than 100 countries, seven days a week, 24 hours a day.

Reduce standstills, minimize downtimes due to failure, and increase the productivity, flexibility and cost efficiency of your plant.

OUR OFFER FOR GEAR UNITS AND COUPLINGS AT A GLANCE.
